Eisenhower

V2	Urgent	Not Urgent
Important	**Do — Your MVP** • Create a React page with a form for the model's required inputs. • Build an R API endpoint that loads the saved model and accepts a fictional profile. • Connect the React form to the API and display the returned estimate. • Validate inputs and show clear errors if values are missing or invalid. • Explain the study population and limitations beside the result.	**Schedule — For V2.0+** • Add a performance dashboard with measures such as AUC and calibration. • Let users compare estimates across bone sites or fictional profiles. • Improve the visual design and accessibility. • Deploy the frontend and API online. • Add API documentation for other developers.
Not Important	**Delegate — Use a library** • Use React component libraries for form controls and layout. • Use R Plumber to expose the existing R prediction function as an API. • Use the model package's existing prediction function. • Use an existing charting library for performance visualizations.	**Delete — Cut it** • Add user accounts or login. • Save visitor profiles or collect real patient information. • Add a database when the app does not need to store profiles. • Automatically retrain the model from website entries. • Give diagnosis, treatment, or screening recommendations.
